NEW MEXICO INFLUENZA SURVEILLANCE UPDATE from the Epidemiology and Response Division of the New Mexico Department of Health (NMDOH)
Weekly Report ending March 12, 2005

Summary of Influenza Activity in New Mexico for Week Ending March 12, 2005:
- Eighteen of the 18 sentinel sites reported a total of 4897 patient visits, of which 83(1.69%) were for an influenza-like illness\(^1\). The previous week ending March 5 reported 1.56 % influenza-like illness.
- NMDOH received reports of 48 patients with positive influenza (31 influenza A, 17 influenza B) tests using rapid testing. There were no reports of positive influenza by culture.
- NMDOH reported the state influenza activity as “LOCAL” to the Centers for Disease Control and Prevention (CDC) (see table below for definitions). Region IB (San Juan, Los Alamos, Sandoval, McKinley, Cibola, Valencia and Torrance Counties) reported ILI of greater than 2.5.

Laboratory Activity in NM:
- To date this season, there has been 28 influenza A virus isolates (22 subtyped as H3)* and 32 influenza B isolates (all of which have been subtyped as Shanghai-like)* identified by culture at NMDOH Scientific Laboratory Division (SLD). After the first report of culture-confirmed influenza for the season, influenza activity reported to the CDC includes results from influenza rapid testing, fluorescent antibody (DFA) methods, or cultures.
- For the week ending March 12, 2005, 12 clinical laboratories reported performing 419 rapid or DFA tests, of which 31(7.40%) were positive for influenza A and 17(4.06%) were positive for influenza B.
- Since October 24, 2004, NMDOH has received reports of 306(6.08%) positive influenza A tests, 228(4.53%) positive influenza B tests and 48(0.95%) indistinguishable\(^2\) positive influenza out of 5035 rapid tests performed at 16 clinical laboratories.

*These cases may also be counted among the rapid test positive results.

Influenza-related Pediatric Mortality
During the week ending March 5, there were two influenza-related pediatric deaths reported to CDC. A total of 15 cases of influenza-associated pediatric deaths have been reported nationally to CDC from 11 states this season (California, Colorado, Georgia, Maine, Massachusetts, Mississippi, New Jersey, New York, Ohio, Pennsylvania and Vermont). No cases have been reported to the NMDOH.

---

\(^1\) Influenza-like Activity (ILI) is defined as Fever (≥ 100°F [37.8° C], oral or equivalent) AND cough and/or sore throat in absence of a KNOWN cause other than influenza.

\(^2\) Some rapid influenza tests cannot differentiate between types A and B.
Flu Activity in the Region
For the week ending March 5 (the most recent data available), influenza activity was reported as “widespread” by Colorado, Idaho, Nevada and Wyoming, “regional” by Arizona, Montana, Texas and Utah and “local” by New Mexico. There were 3 reports of influenza A (H3N2) virus, 51 influenza A that were not subtyped and 38 influenza B viruses in the Mountain region (Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah and Wyoming).

National Flu Surveillance and Laboratory Activity
For the week ending March 5, 838 (21.0 %) of 3,985 specimens tested for influenza viruses were positive. Of these, 73 were influenza A (H3N2) virus, 541 were influenza A that were not subtyped, and 224 were influenza B viruses. Nationwide 4.0% of patient visits to U.S. sentinel providers were due to influenza-like-illness. Twenty-four states reported widespread activity, 20 states reported regional activity, 5 states reported local activity and one state did not report nationally. More information on national surveillance can be found at http://www.cdc.gov/flu/weekly/.

*****************************************************************************
This information is collected by the Infectious Disease Epidemiology Bureau, Epidemiology Response Division, NMDOH. For questions, please call 505-827-0006. For more information on influenza go to the NMDOH web page: http://www.health.state.nm.us/flu/ or the CDC web page: http://www.cdc.gov/ncidod/diseases/flu/fluivirus.htm

4 All data are preliminary and change as more reports are received after the end of the reporting week.

</table>

* ILI activity can be assessed using a variety of data sources including sentinel providers, school/workplace absenteeism, and other syndromic surveillance systems that monitor influenza-like illness.
† Lab confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR. Care should be given when relying on results of point of care rapid diagnostic test kits during times when influenza is not circulating widely. The sensitivity and specificity of these tests vary and the predicative value positive may be low outside the time of peak influenza activity. Therefore, a state may wish to obtain laboratory confirmation of influenza by testing methods other than point of care rapid tests for reporting the first laboratory confirmed case of influenza of the season.
‡ Institution includes nursing home, hospital, prison, school, etc.
**Region: population under surveillance in a defined geographical subdivision of a state. A region could be comprised of 1 or more counties and would be based on each state’s specific circumstances. Depending on the size of the state, the number of regions could range from 2 to approximately 12. The definition of regions would be left to the state but existing state health districts could be used in many states. Allowing states to define regions would avoid somewhat arbitrary county lines and allow states to make divisions that make sense based on geographic population clusters. Focusing on regions larger than counties would also improve the likelihood that data needed for estimating activity would be available.
