NMDOH reported the state influenza activity as “Widespread” to the Centers for Disease Control and Prevention (CDC). See the table on page 3 for full definitions of activity levels. As of February 29th, the Scientific Lab Division (SLD) has received 406 culture specimens since the beginning of the season. One hundred and thirty-four specimens (33%) have been culture-positive and finalized for sub-typing: 61 type A/H1, 10 type A/H3 and 63 type B (Yamagata Lineage).

Summary of Influenza Activity in New Mexico for Week Ending 2/23/08:
- Twenty-five of the 25 sentinel provider sites reported a total of 8,736 patient visits, of which 415 (4.8%) were positive for an influenza-like illness (ILI). The previous week ending February 16th reported 4.1% influenza-like illness.

Summary of Sentinel Laboratory Activity in New Mexico:

| Period of 2007-2008 Influenza Season | Number of Tests Performed** | Positive Type A (n,%) | Positive Type B (n,%) | Positive Type Unknown2 (n,%) | Total Positive All Types (n,%)
|-------------------------------------|-----------------------------|----------------------|-----------------------|-----------------------------|-----------------------------
| Week ending 2/23/08 (30 of 31 labs reporting) | 1470 | 117 (8.0%) | 91 (6.2%) | 67 (4.6%) | 275 (18.7%)
| Cumulative from 10/1/07 to present | 12,016 | 871 (7.3%) | 624 (5.2%) | 325 (2.7%) | 1820 (15.2%)

**Includes rapid antigen and immunofluorescence testing (i.e., direct fluorescent antibody staining)
Note: The sensitivity and specificity of point of care rapid diagnostic tests vary during times when influenza is not circulating widely. The NM Influenza Surveillance Program expects some false positive rapid diagnostic results outside the time of peak influenza activity (i.e., beginning and end of season). The first NM laboratory confirmed case of the influenza season is based on a positive viral culture result.

Influenza-Related Pediatric Mortality:
Since September 30, 2007, CDC has received a total of twenty-four reports of influenza-associated pediatric deaths that occurred during the current season. NM has reported one influenza-related pediatric death this season.

1 Weekly ILI and lab data may change as additional reports are compiled.

2 Influenza-like Activity (ILI) is defined as Fever (≥ 100°F [37.8°C], oral or equivalent) AND cough and/or sore throat in absence of a KNOWN cause other than influenza.

3 Some rapid influenza tests cannot differentiate between types A and B.
National Flu Surveillance and Laboratory Activity, Week Ending 2/23/08:
Nationwide, for the week ending 2/23/08, 5.7% of patient visits to U.S. sentinel providers were due to ILI, which is above the national baseline of 2.2%. Influenza activity was reported as ‘Widespread’ by 49 states, ‘Regional’ by 1 state (Florida), and ‘Local’ by the District of Columbia. More information on national surveillance can be found at: http://www.cdc.gov/flu/weekly/.

During this same week, the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NREVSS) laboratories reported 7,726 specimens tested for influenza viruses; 2,321 (30%) of which were positive: 67 influenza A/H1, 437 influenza A/H3 viruses, 1,193 influenza A viruses that were not subtyped, and 624 influenza B viruses.

Antigenic Characterization:
CDC has antigenically characterized 303 influenza viruses [157 influenza A (H1N1), 77 influenza A (H3N2) and 69 influenza B viruses] collected by U.S. laboratories since September 30, 2007.

Influenza A (H1) [157]
- One hundred twenty-four (79%) of the 157 viruses were characterized as A/Solomon Islands/3/2006, the influenza A (H1) component of the 2007-08 influenza vaccine for the Northern Hemisphere and the 2008 influenza A (H1) component for the Southern Hemisphere.
- Nineteen (12%) of the 157 viruses showed somewhat reduced titers with antisera produced against A/Solomon Islands/3/2006.
- Fourteen (9%) of the 157 viruses were characterized as A/Brisbane/59 which is a recent antigenic variant of the A/Solomon Islands/03/2006.

Influenza A (H3) [77]
- Twelve (16%) of the 77 viruses were characterized as A/Wisconsin/67/2005-like, the influenza A (H3) component of the 2007-08 influenza vaccine.
- Sixty-one (79%) of the 77 viruses were characterized as A/Brisbane/10/2007-like. A/Brisbane/10/2007 is a recent antigenic variant which evolved from A/Wisconsin/67/2005-like. A/Brisbane/10/2007-like virus is the recommended influenza A (H3) component for the 2008 Southern Hemisphere vaccine.
- Four (5%) of the 77 viruses showed somewhat reduced titers with antisera produced against A/Wisconsin/67/2005 and A/Brisbane/10/2007.

Influenza B [69] (B/Victoria/02/87 and B/Yamagata/16/88 lineages)
Victoria lineage [4]
- Four (6%) of the 69 influenza B viruses belong to the B/Victoria lineage.
  - Two (50%) of these 4 viruses were characterized as B/Ohio/01/2005-like. The recommended influenza B component for the 2007-08 influenza vaccine is a B/Malaysia/2506/2004-like virus, belonging to the B/Victoria lineage. B/Ohio/01/2005 is a recent reference strain of the B/Malaysia/2506/2004-like virus.
  - Two (50%) of these 4 viruses showed somewhat reduced titers with antisera produced against B/Ohio/01/2005 and B/Malaysia/2506/2004.

Yamagata lineage [65]
- Sixty-five (94%) of the 69 influenza B viruses were identified as belonging to the B/Yamagata lineage.
This information is collected by the Infectious Disease Epidemiology Bureau, Epidemiology Response Division of NMDOH. For questions, please call 505-827-0006.

For Border influenza activity (southern New Mexico and the Juarez, Chihuahua, Mexico areas), please refer to the NM/Mexico Border Influenza Surveillance Report at: http://www.health.state.nm.us/flu/ under Border Surveillance Reports.

For more information on influenza go to the NMDOH web page: http://www.health.state.nm.us/flu/ or the CDC web page: http://www.cdc.gov/ncidod/diseases/flu/fluivirus.htm

*Influenza-like illness: Fever (≥ 100°F [37.8°C], oral or equivalent) and cough and/or sore throat (in the absence of a known cause other than influenza)
†Lab confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR. Care should be given when relying on results of point of care rapid diagnostic test kits during times when influenza is not circulating widely. The sensitivity and specificity of these tests vary and the predictive value positive may be low outside the time of peak influenza activity. Therefore, a state may wish to obtain laboratory confirmation of influenza by testing methods other than point of care rapid tests for reporting the first laboratory confirmed case of influenza of the season.
‡Institution includes nursing home, hospital, prison, school, etc.
**Region: population under surveillance in a defined geographical subdivision of a state. A region could be comprised of 1 or more counties and would be based on each state’s specific circumstances. Depending on the size of the state, the number of regions could range from 2 to approximately 12. The definition of regions would be left to the state but existing state health districts could be used in many states. Allowing states to define regions would avoid somewhat arbitrary county lines and allow states to make divisions that make sense based on geographic population clusters. Focusing on regions larger than counties would also improve the likelihood that data needed for estimating activity would be available.
