NEW MEXICO INFLUENZA SURVEILLANCE UPDATE
2011 - 2012 Influenza Season

Epidemiology and Response Division, New Mexico Department of Health (NMDOH)

Influenza Activity in New Mexico for Week Ending December 24, 2011 (MMWR Week 51)

Influenza in the State was **no activity to low activity** by several indicators¹:

- **Outpatient Visits for Influenza-like illness (ILI)**: a total of 21 out of 26 sentinel outpatient provider sites reported 6,016 patient visits, of which 144 (2.4%) were identified as visits for ILI². The previous week ending December 17th reported 1.9% influenza-like illness. See graph below displaying the comparison of statewide ILI activity to national ILI activity percentage.

1. National % ILI 2011-2012
2. NM % ILI 2011-2012
3. National Baseline
By Health Regions within the state (refer to page 4 table footnote defining the regions by county), activity was at low to slightly increased levels with a range of 0.7% ILI (Regions 1 and 3) to 3.8% ILI (Region 2). See graph below for the current season’s ILI by region.

- **Laboratory tests for influenza:** since early October, the Scientific Lab Division (SLD) has reported one positive sample for influenza (influenza type B) by PCR. The Influenza Surveillance Program also received report from a commercial lab based in the state of an additional positive influenza sample (influenza type B) detected on culture. That brings the total positive influenza samples to six, all influenza type B, detected via the laboratory surveillance system since early October.

- **Influenza-related deaths:** there have been no reports of deaths, adult or pediatric, caused by lab-confirmed influenza in New Mexico since the beginning of the season in early October.
NMDOH reported the state influenza activity as “Sporadic” to the Centers for Disease Control and Prevention (CDC). See the table on page 3 for full definitions of activity levels. Below is a map of the U.S displaying New Mexico activity in comparison to influenza activity in bordering states, regions and nationally.

---

1 Weekly ILI and lab data may change as additional reports are compiled.

2 Influenza-like Activity (ILI) is defined as Fever ($\geq 100^\circ F$ [37.8$^\circ C$], oral or equivalent) AND cough and/or sore throat in absence of a KNOWN cause other than influenza.

---

This information is collected by the Infectious Disease Epidemiology Bureau, Epidemiology Response Division of NMDOH.
For questions, please call 505-827-0006. For more information on influenza go to the NMDOH web page: http://www.health.state.nm.us/flu/ or the CDC web page: http://www.cdc.gov/ncidod/diseases/flu/fluvirus.htm
Influenza-like illness: Fever (>100°F [37.8°C], oral or equivalent) and cough and/or sore throat (in the absence of a known cause other than influenza)†

Lab confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR. Care should be given when relying on results of point of care rapid diagnostic test kits during times when influenza is not circulating widely. The sensitivity and specificity of these tests vary and the predicative value positive may be low outside the time of peak influenza activity. Therefore, at the start of the season, NMD OH uses lab confirmation by PCR or culture to declare the presence of lab-confirmed influenza in the state. Positivity by other lab methods is recognized and tracked as another influenza activity indicator as the season progresses.

**Region: population under surveillance in a defined geographical subdivision of a state. A region could be comprised of 1 or more counties and would be based on each state’s specific circumstances. In New Mexico, the NMDOH regions are: Region 1—San Juan, McKinley, Sandoval, Cibola and Valencia counties; Region 2—Rio Arriba, Taos, Colfax, Union, Mora, Santa Fe, San Miguel and Guadalupe counties; Region 3 — Bernalillo county; Region 4 — Harding, Quay, Curry, DeBaca, Roosevelt, Chaves, Eddy and Lea counties, and Region 5 – Torrance, Lincoln, Socorro, Catron, Grant, Sierra, Otero, Dona Ana, Luna and Hidalgo counties.
