Summary of Activity: Week 14
April 2nd – April 8th, 2017

- New Mexico ILI activity is currently 1.7% which is below the national baseline
- US ILI is 2.6% which is above the national baseline of 2.2%
- Influenza activity is above the NM baseline of 2.6% in one health region
- There was PCR confirmed lab activity in three of five health regions this week
- No new influenza-related outbreaks have been reported this week

* This map indicates geographic spread & does not measure the severity of influenza activity
New Mexico Department of Health (NMDOH) is collaborating with 29* ILI sentinel sites for the 2016-2017 season. Sites report weekly on the number of patients that present to their facility with influenza-like illness. That number is then divided by the total number of patients seen for any reason, resulting in percent of ILI activity. ILI is defined as fever of > 100°F and cough and sore throat in absence of known cause.

### Regional ILI Activity

#### Outbreak:
An influenza outbreak is defined as at least two cases of ILI in a specific area with at least one lab confirmed case.

#### PCR Testing:
Polymerase Chain Reaction (PCR) tests can identify the presence of influenza viral RNA in respiratory specimens. PCR testing is performed at various laboratories across New Mexico.

**Outbreak**
An influenza outbreak is defined as at least two cases of ILI in a specific area with at least one lab confirmed case.

**PCR Testing:**
Polymerase Chain Reaction (PCR) tests can identify the presence of influenza viral RNA in respiratory specimens. PCR testing is performed at various laboratories across New Mexico.
Since the start of the 2016-2017 influenza season, laboratories have reported that a total of 2,375 out of 14,084 respiratory specimens have tested positive for influenza by PCR. Twenty-seven positive specimens were subtyped as A(H1N1), 1,038 were A(H3N2), 1,070 influenza A specimen was not subtyped. One hundred ninety-eight tested positive as influenza B not subtyped, 2 positive specimens were identified as B(Victoria) and 33 as B(Yamagata).

**Pneumonia death:** Is defined as have a cause of death that related to pneumonia & influenza (P & I) not including: aspiration pneumonia, pneumonitis, or pneumococcal meningitis.

**Influenza death:** Is defined as have a cause of death that related to pneumonia & influenza (P & I) not including: parainfluenzae or Haemophilus influenzae.

*There are significant reporting delays and counts represent cases reported to date by the NMDOH BVRHS or OMI

Antiviral Information and Data

Persons at higher risk for influenza complication recommended for antiviral treatment include:

- Children aged younger than 2 years & adults aged 65 years and older
- Persons with chronic medical conditions
- Persons with immunosuppression, including that caused by medications or by HIV infection
- Women who are pregnant or postpartum (within 2 weeks after delivery)
- Persons aged younger than 19 years who are receiving long-term aspirin therapy
- American Indians/Alaska Natives
- Persons who are morbidly obese (i.e., BMI is 40 or greater)
- Residents of nursing homes and other chronic-care facilities
Appendix

*Geographic spread is based on CDCs activity estimates definitions. For more information visit: [http://www.cdc.gov/flu/weekly/overview.htm](http://www.cdc.gov/flu/weekly/overview.htm)

In accordance with New Mexico Administrative Code (NMAC) 7.4.3.13 Influenza is a reportable condition for the following:
- Influenza, laboratory confirmed hospitalizations only
- Influenza-associated pediatric death
- Acute Illness or condition of any type involving large numbers of persons in the same geographic area (outbreaks)
- Other illnesses or condition of public health significance (novel influenza A)

For more information on reportable conditions please visit: [http://www.nmcpr.state.nm.us/nmac(parts/title07/07.004.0003.htm](http://www.nmcpr.state.nm.us/nmac(parts/title07/07.004.0003.htm)
