Specific populations in STD protocol addendum:

Diagnostic testing and screening for pregnant women

For syphilis:

- ALL pregnant women should be screened for syphilis as soon as suspected pregnancy is confirmed in a health office at any gestational age.
- This preliminary syphilis test does not take the place of regularly scheduled prenatal lab testing - referral to a prenatal provider, maternal-child health provider, or primary care provider for prenatal care is recommended. For pregnant Title X clients, a referral for prenatal care is required.
- Pregnant women who test negative in their first trimester should be advised to return for syphilis testing after 26 weeks gestation if they do not have regular prenatal care.

WOMEN

- Any woman who is a known contact to a partner with syphilis or who is identified as part of a syphilis case investigation
- Women in high risk populations
  - Women with HIV infection
  - Women who exchange sex for drugs or money
  - Transgender persons
  - Women whose male sex partners report having male sex partners (MSM)
  - Women who self-report methamphetamine or opioid use or who report a partner who uses methamphetamines or opioids.
- Screening of sexually active women should be considered in the following settings:
  - Areas or populations with active syphilis outbreaks or known ongoing disease transmission
- Screening of pregnant women is recommended as a component of prenatal care. Given recent increases in syphilis among women in New Mexico, with an increase in congenital syphilis cases, ALL pregnant women should be screened for syphilis as soon as suspected pregnancy is confirmed by the health office at any gestational age. This preliminary syphilis test does not take the place of regularly scheduled prenatal lab testing and referral to a prenatal provider, maternal-child health provider, or primary care provider for prenatal care is recommended. For pregnant Title X clients, a referral for prenatal care is required.
In general, routine screening of non-pregnant women < age 20 seen in STD clinics or seeking STD care or evaluation who do not have any of the above listed risk factors is much lower yield for disease detection. However, individual cases may warrant screening - contact a clinician for a review and order as needed.
