Asthma is a common chronic lung condition affecting people of all ages. It causes repeated episodes of wheezing, breathlessness, chest tightness, and nighttime or early morning coughing. About 1 in 13 New Mexicans suffer from asthma (8.4% of adults and 5.4% of children). People with asthma have inflamed airways which are sensitive to things that may not bother other people. These things are called “triggers.” Asthma triggers vary from person to person, and many exist in our environment. Some people react to only a few while others react to many. People may also have different exposures based on housing, work, and school conditions, and where they live. Environmental triggers can be substances that cause allergies (allergens).

Some common allergens are:
- dust mites
- cockroaches
- pollen
- molds
- pet dander

Irritants in the environment can also cause an asthma episode. These irritants can include:
- smoke from cigarettes
- air pollution (such as smog and ozone)
- wood fires, including wildfires
- strong fumes, vapors or odors (such as paint, gasoline, and perfumes)
- dust and particles in the air
- chemicals

This report summarizes trends in reported exposure to environmental triggers among individuals with asthma in New Mexico and the United States.
ENVIRONMENTAL EXPOSURES AMONG THOSE WITH CURRENT ASTHMA

About 1 in 10 New Mexicans with current asthma report having mold in their home, and 1 in 5 adults report having cockroaches in their home. High proportions of those with current asthma report cooking with gas stoves, having pets indoors, and having carpeting in bedrooms. About 1 in 3 adults report that their current job has made their asthma worse, and 14% of children report having mold in their school.

ENVIRONMENTAL MODIFICATIONS AMONG THOSE WITH CURRENT ASTHMA

The majority of New Mexicans with current asthma report using strategies such as ensuring they have and use a bathroom and/or kitchen fan. Other modifications, such as using a mattress and/or pillow dust mite cover are not as commonly implemented. About 1 in 3 people with current asthma report that a healthcare provider has talked to them about modifying their home, work, or school environment to improve their asthma control.

*Among those who allow pets in the home.
The Urban Institute analyzed the American Housing Survey to explore nation-wide variations in asthma prevalence and asthma-related emergency department use among school-age children (ages 5 to 17) by a wide array of housing and household characteristics, including exposure to asthma triggers (e.g., smoke, mold, rodents, and cockroaches), tenure (renter or owner), and receipt of government assistance in paying rent. Some key findings include:

- **Asthma prevalence.** Households with kids are more likely to have at least one child with asthma when they also report exposure to smoke, mold, and leaks in their home.

- **Emergency department (ED) and urgent care visits.** Smoking inside the home and mold in the bedroom are associated with more ED and urgent care visits among households with an asthmatic child.

- **Housing tenure.** Renters with kids are more likely to have asthma triggers in their homes than owners (figure below) and are more likely to have at least one child with asthma.

- **Rental assistance.** Assisted renters have higher exposure to certain indoor asthma triggers (e.g., smoke, mold) than other low-income renters not receiving any government rental assistance and are more likely to have at least one child with asthma in the household.

ENVIRONMENTAL EXPOSURES AND MODIFICATIONS AMONG NM ADULTS AND CHILDREN

### Data Sources & References

The New Mexico Department of Health Asthma Call-Back Survey: This survey is an in-depth asthma survey conducted with Behavioral Risk Factor Surveillance System Survey respondents who report an asthma diagnosis.
